5775 Yonge Street, Suite 1902
Toronto, ON M4T 1W1

Re: Energy Market Associate

Dear Edgecom Energy Hiring Team,

I'm applying for the Energy Market Associate role, and I'll be direct about where I fit and where I don't.

What I bring is the loop this job runs on: take operational data, find the trend and the root cause, turn it into a change in how the work actually gets done, then report the result to the people who depend on it. At Aifuku I analyzed data across five linked operational systems, root-caused the failures that were corrupting reporting, and built the fix — an automated pipeline that parsed source documents into structured records and verified them against the ledger, removing manual entry. At Sinolink Securities I standardized and documented the team's data collection and reporting workflows, cutting duplicate entry and improving team efficiency by 8%. At Grow Investment Group I owned the analysis and the client-facing materials for an institutional program that ended with 9% fewer client redemptions, 4% more inquiries, and 12% higher conversion. In each case the analysis was only the first half; the deliverable was a changed process and a number that moved.

Where I don't fit yet is the obvious one. I have not worked in the electricity sector and I have not run a Capacity Auction obligation. I won't pretend that's minor — availability, test events, dispatch notifications, and settlement verification each have failure modes you only learn by doing them. What I have done is work through the IESO's Capacity Auction rules and DR participation materials so that I start in the market's own vocabulary rather than from first principles. That is reading, not operating experience. But I've entered three domains cold — investment banking, asset management, and operations data — and in each the domain knowledge took weeks while the analytical work started immediately.

Two things also line up directly. The 5CP forecasting backup duty is time-series work; my forecasting project used seasonal ARIMA and Holt-Winters with explicit 95% prediction intervals, because a peak forecast without an uncertainty band isn't actionable. And the preferred qualification you list — SQL, Python, or BI tools for reporting automation — is where I'm strongest, not where I'd be learning.

A small team where the analysis I do reaches customers and changes how the business runs is the environment I'm looking for. I'd welcome the chance to talk.

Sincerely,

Tao (Tony) Jin
